

Collegians For A Constructive Tomorrow

FREE-MARKET ENVIRONMENTALISM 101

Why the free market?

Most consumer and environmental problems can best be met and overcome by better unleashing the power of the free-enterprise system and the ingenuity of science and technology.

Clean Air and Water

Flexible and local approaches to the pollution concerns of some communities will offer the best solution, and anti-pollution efforts should be reviewed to ensure they reflect sound science.

Domestic Energy Production

The expanded utilization of our domestic coal, nuclear, oil, and natural gas resources is essential for a stable economy. Private enterprise and free market competition will allow renewables to become viable alternatives without the need for government mandates or subsidies.

Protection of Wildlife

To protect endangered species, policies that encourage land-owner cooperation, respect private property right, and utilize market-based incentives should be pursued wherever possible.
